SUMMARY

Enthusiastic Software Engineering student with hands-on experience in full-stack web development, AWS serverless architecture, and Unity game development through academic and personal projects. Skilled in React, JavaScript, ASP.NET Core, Node.js, and C#/Unity. Passionate about solving problems, designing scalable systems and game mechanics, and continuously learning new technologies in a team environment.

EDUCATION

Saigon University

Bachelor of Software Engineering

Sep 2022 – Aug 2026 (Expected)

GPA: 3.0/4.0

TECHNICAL SKILLS

- **Languages:** JavaScript, TypeScript, Java, C#, SQL
- **Frontend:** React, Ant Design, TailwindCSS, Vite, HTML, CSS
- **Backend:** Spring Boot, Django, .NET, ASP.NET Core, Node.js
- **Database:** MySQL, SQL Server, PostgreSQL, DynamoDB
- **Cloud & AWS:** AWS Lambda, API Gateway, DynamoDB, S3, Cognito, AWS SAM
- **Game Development:** Unity, C#, Universal Render Pipeline (URP), Unity Input System, NavMesh AI, ScriptableObjects, HLSL Shaders, Cinemachine
- **Tools:** Git, GitHub, Postman, Docker, Swagger
- **Soft Skills:** Problem Solving, Teamwork, Communication
- **English:** B2

PROJECTS

AWS Serverless Spotify Clone • Team project (2 members)

2025

- **Role:** Full-Stack Developer
- **Description:** A music streaming platform built entirely on AWS serverless architecture, mirroring Spotify's core features for audio streaming, playlist management, and social interaction
- **Using:** React, Vite, Tailwind CSS, Redux Toolkit, Node.js, AWS Lambda, API Gateway, DynamoDB, S3, Cognito, AWS SAM, Swagger/OpenAPI
- **Architecture:** Serverless, Clean Architecture (Domain/Application/Infrastructure/Interfaces), RESTful API, Infrastructure as Code (IaC)
- **Key achievements:**
 - * Designed and deployed a fully serverless backend using AWS Lambda (Node.js), API Gateway (HTTP API), and DynamoDB with a denormalized 5-table schema (Users, Songs, Playlists, UserInteractions, Messages), defined via AWS SAM for reproducible Infrastructure-as-Code deployments
 - * Implemented Cognito-based authentication (registration, OTP email confirmation, login, refresh token rotation) with role-based access control (listener, artist, admin) and an artist request approval workflow for admin moderation
 - * Developed a presigned-URL upload pipeline to Amazon S3 for secure and scalable audio/image uploads directly from the client
 - * Optimized list endpoints with cursor-based pagination and soft-delete patterns; authored API contracts via Swagger/OpenAPI specifications for smooth frontend-backend integration
 - * Built frontend features including music player, playlist management, favorite songs library, and real-time direct messaging, with Redux Toolkit for state management
 - * Enabled rapid iteration with local Lambda testing via SAM CLI and Docker before cloud deployment

Action RPG – 2.5D Action Role-Playing Game • Team project (2 members)

2026 – Present

- **Role:** Unity Developer & Gameplay Programmer – owned in-engine implementation, systems programming & editor tooling; partner led game design & planning
- **Description:** A 2.5D action RPG with directional combat, class-based skill trees, companion AI, and a vision/fog-of-war system, built on a modular, data-driven architecture across 140+ C# scripts
- **Using:** Unity Engine, C#, Universal Render Pipeline (URP), Unity Input System, NavMesh AI, Cinemachine, ScriptableObjects, HLSL Shaders, TextMeshPro
- **Architecture:** Component-based, data-driven design with Factory, Strategy & State-Machine patterns, ScriptableObject databases, and a DAO-based save/load layer
- **Key achievements:**
 - * Engineered a directional combat system with a 5-tier damage model (front → flank → back) where armor/magic-resist penetration and a damage bonus scale with attack angle, layered with crit, auto/manual block, true damage (armor penetration), and a stackable buff/debuff modifier system
 - * Built enemy and boss AI with telegraphed attacks and frame-accurate sweep-past hit detection (wind-up / active / recovery windows), giving players a readable timing window to dodge, plus boss combo and dodge logic
 - * Developed a NavMesh-driven companion AI with a follow / reposition / combat state machine, automatic target scanning, and position-based team-synergy buffs
 - * Implemented a Vision + Fog of War system as a custom URP ScriptableRendererFeature and HLSL post-process shader that reconstructs world position from the depth buffer and blends multiple vision sources (player + companion); covered by edit-mode unit tests
 - * Architected a class-based skill system on the Factory pattern (effect-code → behavior registry) spanning 20+ subclasses with active / signature / passive abilities, cooldowns, and an upgradeable skill tree
 - * Designed a data-driven backbone using ScriptableObject databases (players, weapons, accessories, stats, checkpoints) with a DAO save/load layer, plus drag-and-drop inventory, equipment, and stat-allocation systems
 - * Authored in-house Unity Editor tooling – skill-tree auto-populate, automated fog-of-war renderer setup, and a runtime dev/cheat panel – to accelerate content creation and gameplay iteration

Facebook Clone – Fullstack Social Network • Personal project

2025

- **Role:** Full-Stack Developer
- **Description:** A production-oriented social network clone replicating Facebook's core functionalities with clean architecture, real-time capabilities, and containerized deployment
- **Using:** ReactJS, Vite, TypeScript, Axios, TailwindCSS, ASP.NET Core Web API, C#, Entity Framework Core, PostgreSQL, Redis, SignalR, JWT, FluentValidation, Docker Compose, Nginx
- **Architecture:** Clean Architecture with logical microservices (Auth, User, Post, Chat, Notification, Media) behind an API Gateway, RESTful API, real-time communication, cache layer
- **Key achievements:**
 - * Architected backend as logical microservices (Auth, User, Post, Chat, Notification, Media) behind a shared API Gateway, designed for future physical service decomposition
 - * Implemented JWT authentication with 15-minute access tokens, 7-day DB-stored refresh tokens, BCrypt password hashing, and secure token rotation
 - * Built core social features (feed with post/like/comment/share, friend system with request/accept/reject/unfriend, groups module, cross-entity search) with optimized DB indexing, UUID primary keys, and soft deletes for data integrity
 - * Implemented real-time chat using SignalR with typing indicators, online status, and Redis-backed presence
 - * Developed Reels (short-form video) with chunked video upload supporting pause/resume for large files
 - * Combined Entity Framework Core (standard CRUD) and Dapper (performance-critical queries: feed generation, search) for optimal database access
 - * Containerized the full stack with Docker Compose (Nginx, backend services, PostgreSQL, Redis) for reproducible deployment

Sale Management System • Team project (5 members)

2024

- **Role:** Frontend Developer
- **Description:** A comprehensive CMS-based web application

- **Using:** React 19, Vite, Tailwind CSS, Chart.js, JWT, Swagger
- **Architecture:** RESTful API, Token-based Authentication
- **Key achievements:**
 - * Designed and implemented Product Management Page with full CRUD operations for inventory control
 - * Created Analytics Dashboard with Chart.js visualizations for sales insights and business performance metrics
 - * Integrated JWT token-based authentication system for secure user login and session management
 - * Collaborated closely with backend developers to integrate UI components with REST APIs
 - * Utilized Swagger for interactive API documentation, facilitating easier testing and faster frontend-backend integration
 - * Implemented PDF generation and file export functionality using JavaScript jsPDF and html2canvas for reporting purposes
 - * Implemented responsive design for tablet devices, ensuring optimal user experience across different screen sizes

Mobile Shopping App • Team project (4 members)

2024

- **Role:** Mobile Frontend Developer
- **Description:** Cross-platform mobile application for online product purchases
- **Using:** Uno Platform, C# (.NET), Swagger
- **Architecture:** RESTful API, Cross-platform Mobile Development
- **Key achievements:**
 - * Developed Shopping Cart Page with dynamic product quantity adjustment, removal, and promotional code application features
 - * Built Order Confirmation Page displaying comprehensive user information and order details before purchase
 - * Implemented toast notification system to provide real-time order status feedback (success/failure)
 - * Utilized Swagger for interactive API documentation, facilitating easier testing and faster frontend-backend integration
 - * Ensured consistent UI/UX across Web and Android platforms using Uno Platform's cross-platform capabilities
 - * Integrated frontend with backend REST APIs for data synchronization
